

Course Prerequisite

Prepared by: SO Vengleab

Date: Jul - 2026

Prerequisite

- Python 3.12+
- Anaconda & JupyterLab
- IDE Installed (Antigravity, Visual Studio Code, Cursor, Windsurf etc)

Install Python

Installing Python

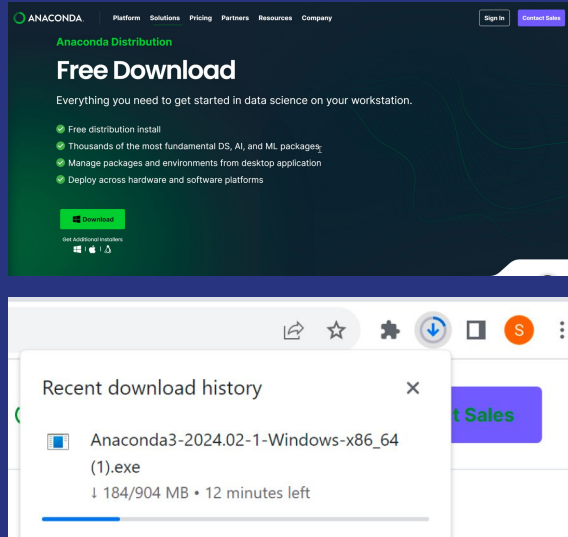

Install Anaconda

Download Anaconda

One installer: Python + Jupyter.

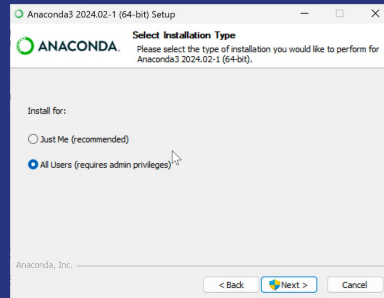

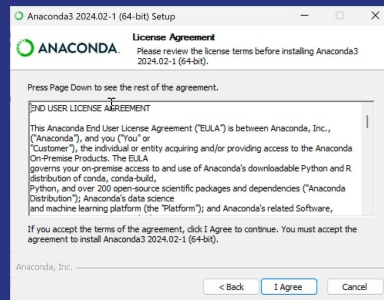

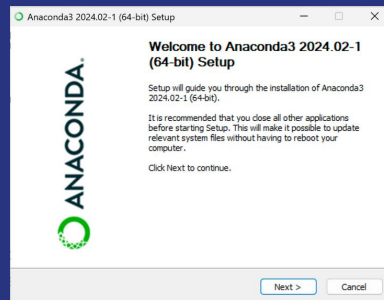

- Go to anaconda.com/download and press the **Download** button.
- The installer appears in your browser's **download history** (top-right corner) — about **900 MB**, so give it a few minutes.

Run the Setup Wizard

Next → I Agree → choose users.

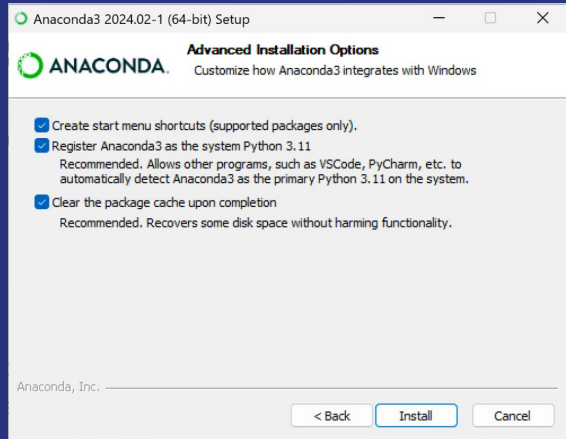

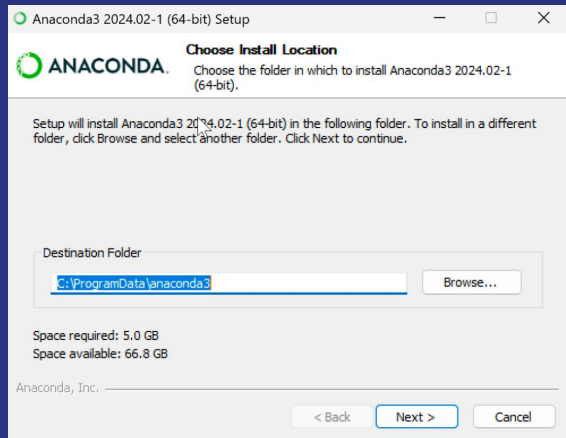

- Open the downloaded **.exe** and click **Next** on the welcome screen.
- Click **I Agree** on the license, then pick **All Users** or **Just Me** and allow the app with **Yes**.

Location and Options

Keep the defaults.

- **Browse** to a destination folder or keep the default (needs ~5 GB), then click **Next**.
- **Select all options** on Advanced Installation — registering Anaconda as system Python lets **VS Code** and **PyCharm** auto-detect it — then **Install**.

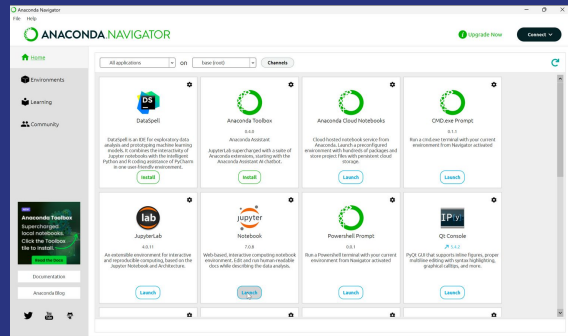

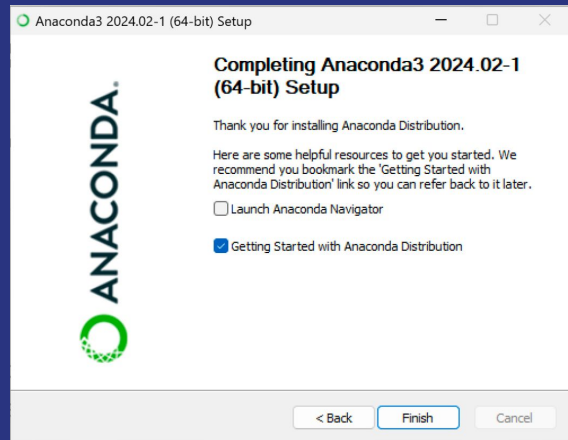

INSTALLATION — STEP 4 OF 4

Finish and Launch

Untick the extras.

- Click **Next** → **Finish**; you can **untick all selections** on the last screen.
- Find **Anaconda Navigator** in the Start menu and press **Launch** on the **Jupyter Notebook** tile (or open Jupyter Notebook directly).

Open Anaconda
